

JACKETED *PipeHugger LP*

Like all other *PipeHugger LP*, Pressure Pulsation Dampers, and Flow Fluctuation Preventors, *PipeHugger LP* is available in both a heating/cooling jacketed form, ① and also with a piping system base block, ②. For dimensions of jacketed Dampers use those of the next larger size, the jackets are generally from the shell of the next larger Damper.

Note the flow through configuration which ensures constant temperature.

Piping system base blocks are available in all machinable materials with any connection orientation and flange or threaded type. They are often used as a transition from pump manufacturers standard to the piping system standard. ③

Note: Base blocks provide ease of mounting, and the ability to change the damper in minimum down time and without disturbing piping integrity.
